CUSTOMER BEHAVIOUR ANALYSIS

Customer Churn Analysis and Retention Strategy

Prepared by: Ganeshprabu

Tool: Python and Google Sheets

Dataset and overall results

1,000	902	98	9.8%
Total customers	Retained customers	Churned customers	Overall churn rate

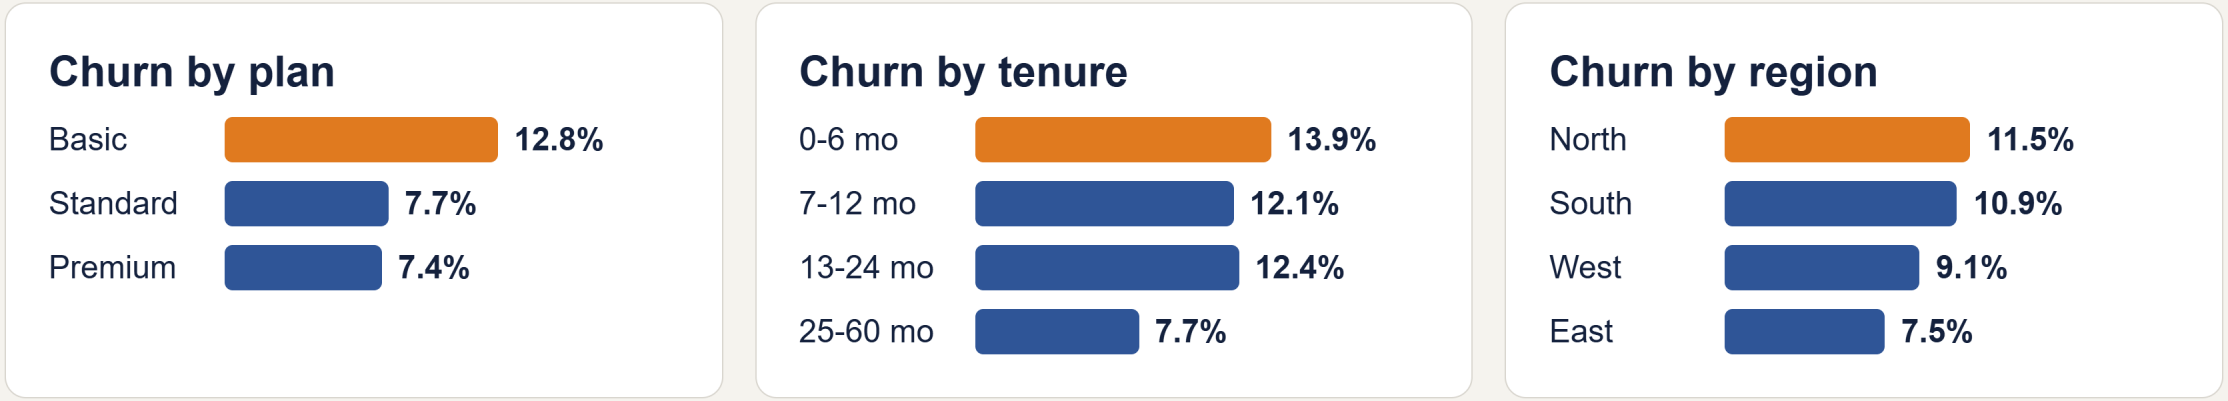

Churn distribution (simulated dataset)

Retained 90.2% (902) | Churned 9.8% (98)

Dataset is simulated

Customer groups at risk

Highest churn: **Basic plan (12.8%)**, **0-6 month tenure (13.9%)** and **North region (11.5%)**, against a 9.8% average.

Simulated dataset - findings apply to the generated sample, not real customers

Disengagement patterns

Complaints

Retained **1.45**

Churned **2.20**

52% higher for churned customers

Payments

On-time churn **8.5%**

Late churn **13.8%**

Late payers churn 1.6x as often

Usage

Retained avg **50.1**

Churned avg **47.4**

Only 5% lower on average

Strongest patterns: complaints and late payments. The high-complaints segment churns at 13.6% vs 6.6% for others. Usage is the weakest signal: low-usage customers churn at 11.6% vs 8.0%.

Recommendations

- Improve onboarding for high-risk new customers
- Prioritize customers with repeated complaints
- Send helpful reminders to customers with late payments
- Re-engage low-usage customers with personalized support
- Review high-churn plans and regions before changing pricing or services

Conclusion and action plan

- Focus retention efforts on the groups with the strongest evidence of disengagement: repeat complainers and late payers
- Track churn rates before and after interventions
- Test targeted retention actions and compare results

Note: this analysis uses synthetic data; findings describe the generated sample, not real customers.
